

DECIMALS

Multiplying Decimals

Trailing zeros are the zeros at the end of a number that have no nonzero digits after them. Since trailing zeros after the decimal point do not change the value of a decimal, we usually don't write them.

For example, we usually write 0.2 instead of 0.20, 0.2000, 0.200000, and so on.

EXAMPLE | Compute 0.25×0.04 .

We begin by multiplying $25 \times 4 = 100$. Then, we determine where to place the decimal point.

0.25 and 0.04 have a total of $2 + 2 = 4$ digits right of the decimal point.

So, we move the decimal point in 100 so that there are 4 digits to the right of the decimal point, **including** the trailing zeros.

After we have placed the decimal point, we can remove the trailing zeros.

So, $0.25 \times 0.04 = 0.01$.

$$\begin{array}{r} 0.25 \times 0.04 \\ \underline{\quad\quad} \quad \underline{\quad\quad} \\ \quad\quad \end{array}$$

$$\begin{array}{r} 0.0100 \\ \underline{\quad\quad\quad} \\ \quad\quad \end{array}$$

$$0.01$$

Be extra careful when the product of two numbers has trailing zeros!
